

Nyan Studio

User Manual

Version 1.1.2

A focused vocal-recording workflow with direct timeline editing.

FUNtasia Audio

1. Quick Start

1. Open AUDIO SETTINGS and choose your input and output devices. On Windows, select an available ASIO device for low-latency recording and adjust AUDIO BUFFER when needed.
2. Click Add Backing or drag an audio file onto the timeline.
3. Arm the VOX track you want to record by turning on R. Set BPM, time signature, metronome and COUNT-IN 1 BAR if needed.
4. Enable MONITOR for software monitoring. REVERB affects the monitor path only; the recorded vocal remains dry.
5. Press Record. After recording, edit the vocal regions, then drag empty arrangement space or the ruler to create a RANGE before Export.

POINT

Nyan Studio is built around a backing-track vocal-recording workflow. Load at least one backing track before recording or saving a session.

2. Main Screen

Top: session and export settings

- New Session / Open Session / Save Session
- Time signature, Ruler, Export Format / Sample Rate / Bit Depth
- Top-right: AUDIO SETTINGS

Center: timeline

- Track headers: names, R/M/S, Volume and Peak
- Backing / VOX regions, ruler, playhead and the shared RANGE used by Repeat and Export
- Use the horizontal scrollbar below the timeline to move left and right

Bottom: recording, editing and monitoring

- Icon row, BPM, Metronome, Count-In, Zoom, Track Height, MONITOR, REVERB, RANGE, MASTER and Stereo Peak Meter

3. Icon Button Guide

The current UI uses icons for common actions. Every symbol below is centered to the same cell position. An icon may appear faded when an action is unavailable.

Icon	Name	What it does
	New Session	Closes the current work and starts a new empty session.
	Open Session	Opens a .nyanstudio or legacy .nearstudio session.
	Add Backing	Imports an audio file into the Backing area.
	Save Session	Saves the current work as a .nyanstudio session.
	Return to Zero	Moves the playhead to 0:00. Home performs the same action.
	Play	Starts playback from the current playhead. Space toggles Play / Stop.
	Stop	Stops playback.
	Record	Starts or stops recording into the VOX track whose R is armed.
	Repeat	Loops playback inside the current RANGE. The same RANGE is used for Export.
	Add VOX Track	Adds another VOX track, up to 8.
	Delete	Deletes all selected VOX regions.
	Glue / Merge	Combines selected regions on the same VOX track into one region.
	Undo	Reverses the most recent edit. Ctrl+Z.
	Redo	Reapplies an edit that was undone. Ctrl+Y.
	Export Mix	Exports the normal mix using the current RANGE and export settings.
	Vocal Stem Export	Exports eligible VOX tracks as separate files using the current RANGE.
	Metronome	Turns the metronome click on or off. Use VOL for click level.

4. Backing Tracks

Action	How it works
Add	Use Add Backing or drag audio onto the timeline. Up to 8 backing tracks.
Supported formats	WAV / MP3 / AIF / AIFF / FLAC / OGG
Move	Drag the backing region left or right.
Mute / Solo	Use M / S. If any track is Soloed, only Soloed tracks play.
Rename	Double-click the track name. Enter or click elsewhere to commit; Esc cancels.
Reorder	Drag the track-name area up or down. Backing tracks reorder within the Backing group.
Set RANGE	Double-click a backing region to make that entire region the shared RANGE used by Repeat and Export.

5. VOX Tracks and Recording

Item	Description
Track count	Up to 8 VOX tracks. Use Add VOX Track; X removes a VOX track when more than one exists.
R	Record Arm. Selects the VOX track that receives recording.
M / S	Mute / Solo.
Volume / Peak	Each VOX track has its own Volume and Peak Meter.
Rename	Double-click the track name. Clicking elsewhere also commits the edit.
Reorder	Drag the track-name area up or down. VOX tracks reorder within the VOX group.

Recording workflow

1. Enable R on the target VOX track.
2. Set COUNT-IN 1 BAR, metronome and MONITOR as needed.
3. Press Record. Press Record again to stop.
4. The completed take appears as a VOX region on the timeline.

6. Editing Vocal Regions

Action	Mouse / key
Single select	Left-click a VOX region.
Multi-select	Shift + left-click toggles a region in the multi-selection.
Move together	With multiple regions selected, drag the lower half of any selected region to move the whole selection horizontally. Tracks and relative spacing are preserved.
Split (scissors)	Double-click the upper half of a VOX region at the desired split point.
Trim	Drag the left or right edge of a region.
Set region as RANGE	Double-click the lower half of a VOX region.
Create RANGE from empty space	Drag horizontally on empty arrangement space. The blank area below the last track also works.
Glue / Merge	Shift-click 2 or more regions on the same VOX track, then use Glue / Merge or G. Gaps are preserved as silence.
Delete	Press Delete to remove all selected VOX regions.
Undo / Redo	Ctrl+Z / Ctrl+Y. Group move and group delete are each one Undo step.

EDITING TIP Shift is now reserved for multi-region selection. The old Shift-forced range/marquee behavior is not used in v1.1.2.

7. RANGE, Playback and Navigation

Function	Control
Play / Stop	Space toggles Play / Stop. The Stop icon also stops playback.
Return to 0:00	Home or Return to Zero.
Create RANGE	Drag across the ruler, double-click a Backing region, double-click the lower half of a VOX region, or drag empty arrangement space.
Resize RANGE	Drag the triangle handles above IN / OUT.
Clear RANGE	Double-click the ruler.
Repeat	Loops playback inside the current RANGE. The same RANGE is used for Export.
Horizontal scroll	Shift+Wheel or the scrollbar.
Horizontal zoom	Ctrl+Wheel or ZOOM.
Track height	Alt+Wheel or Track Height.

8. AUDIO SETTINGS and Audio Buffer

AUDIO SETTINGS lets you choose input/output devices and the audio buffer. Nyan Studio stores this as an app-level setting and restores it on the next launch.

Buffer	Guide
32 samples	Ultra Low Latency
64 samples	Low Latency
128 samples	Balanced
256 samples	Stable
512 samples	High Stability
Above 512	Maximum Stability

DRIVER CONTROL Some ASIO drivers do not accept Buffer Size changes from Nyan Studio. In that case, use OPEN DRIVER CONTROL PANEL and change the value in the manufacturer driver panel. After the panel closes, Nyan Studio resynchronizes the audio device and displays the active buffer size.

9. BPM, Time Signature and Metronome

- Adjust BPM with the BPM control.
- Choose 3/4, 4/4 or 6/8.
- RULER: BARS shows bars/beats; RULER: TIME shows time.
- Use the Metronome icon to enable/disable the click and VOL for click level.
- COUNT-IN 1 BAR adds one bar before recording starts.

10. Software Monitoring / Monitor Reverb

- MONITOR routes microphone input through Nyan Studio to your headphones/output.
- REVERB affects monitoring only; the recorded vocal remains dry.
- Use headphones to avoid feedback.
- If your interface also provides Direct Monitoring, using both at once may create a doubled vocal.

11. Mixer and Peak Meters

- Each Backing and VOX track has its own Volume and Peak Meter.
- MASTER controls final output level.
- The MASTER stereo meter shows left/right peaks.
- If output exceeds 0 dBFS, CLIP stays red until you click the CLIP area to reset it.

12. Export / Vocal Stem Export

Normal Export

- Choose WAV / FLAC / AIFF, 44.1 / 48 kHz and Bit Depth. 32-bit float is WAV only.
- Create a RANGE, adjust IN / OUT if needed, then use Export Mix.
- Normal Export follows playback Mute / Solo routing and MASTER Volume.

Vocal Stem Export

- Exports one file per eligible VOX track.
- Muted VOX tracks or tracks with no audio inside the RANGE are skipped.
- Each VOX Track Volume is applied. Backing / MASTER / Metronome / Monitor Reverb are not included.

13. Session Files

- The current session extension is .nyanstudio. Legacy .nearstudio sessions are also supported by Open.
- Saving creates a matching “SessionName_Audio” folder next to the session and copies Backing / recorded audio into it.
- Sessions store BPM, time signature, track names, Mute/Solo, Volume, region positions, RANGE, Repeat, Zoom and other working settings.
- Audio device / Buffer Size settings are app-level preferences, not per-session data.
- With Windows file association installed, .nyanstudio files can use the dedicated Session icon.

IMPORTANT When moving or backing up a session, keep the .nyanstudio file together with its matching “_Audio” folder.

14. Keyboard and Mouse Shortcuts

Shortcut	Action
Space	Play / Stop
R	Record / Stop Recording
Home	Return to Zero
Shift + left click	Toggle VOX regions in multi-selection
Delete	Delete all selected regions
G	Glue / Merge (same VOX track)
Ctrl+Z / Ctrl+Y	Undo / Redo
Ctrl+S	Save Session
Ctrl+O	Open Session
Ctrl+N	New Session
Shift+Wheel	Horizontal scroll
Ctrl+Wheel	Horizontal zoom
Alt+Wheel	Track height

15. Troubleshooting

Problem	Check
No microphone monitor	Check input device in AUDIO SETTINGS, MONITOR and headphone/output routing.
Monitoring feels delayed	Try ASIO and a smaller Buffer Size. Also check Direct Monitoring vs Software Monitoring.
Cannot change Buffer Size from Nyan	Some drivers reject host-side changes. Use OPEN DRIVER CONTROL PANEL.
Driver Panel change is not reflected	Open the panel from Nyan Studio and close it to trigger resync. Reopen AUDIO SETTINGS if needed.
Backing is silent	Check M/S, Track Volume and MASTER Volume.
Merge is unavailable	Shift-click 2 or more VOX regions and confirm they are on the same VOX track.
Export is unavailable	Confirm a Backing is loaded and RANGE has non-zero length. 32-bit float requires WAV.
CLIP is red	Lower Track / MASTER Volume, then click CLIP to reset.
Session audio is missing	Keep the .nyanstudio file together with its matching “_Audio” folder.

Nyan Studio v1.1.2

Simple recording. Direct editing. Comfortable vocal monitoring.
