

Nyan Studio

User Manual

Version 1.1.0

A focused vocal-recording workflow with direct timeline editing.

FUNtasia Audio

1. Quick Start

1. Open AUDIO SETTINGS and choose your input and output devices. For low-latency monitoring on Windows, select an available ASIO device.
2. Click the Add Backing icon or drag an audio file onto the timeline.
3. Arm the VOX track you want to record by turning on R. Set BPM, time signature, metronome and COUNT-IN 1 BAR if needed.
4. For software monitoring, enable MONITOR and adjust the REVERB bar. The reverb is monitor-only; the recorded vocal remains dry.
5. Press Record. After recording, move, split or trim the vocal region and export the range you need.

POINT Nyan Studio is built around a backing-track vocal-recording workflow. Load at least one backing track before recording or saving a session.

2. Main Screen

Top: session and export settings

- New Session / Open Session
- Time signature: 3/4, 4/4 or 6/8
- Ruler: BARS / TIME
- Export format: WAV / FLAC / AIFF
- Export sample rate: 44.1 kHz / 48 kHz
- Bit depth: 16-bit / 24-bit / 32-bit float (WAV only)

Center: timeline

- Track headers on the left contain names, R/M/S controls, volume and peak meters.
- Backing and vocal regions appear on the timeline with the ruler, playhead and loop range.
- Use the horizontal scrollbar directly below the timeline to move left and right.

Bottom: transport, editing and monitoring

- Icon row: Add Backing / Save / Return to Zero / Play / Stop / Record / Repeat / Loop / Add VOX / Delete / Glue / Undo / Redo / Export / Stem Export
- BPM, metronome, metronome volume, count-in, horizontal zoom and track-height control
- MONITOR, REVERB, Export RANGE, MASTER Volume and stereo output meter

3. Backing Tracks

Action	How it works
Add	Use Add Backing or drag audio onto the timeline. Up to 8 backing tracks.
Supported formats	WAV / MP3 / AIF / AIFF / FLAC / OGG
Move	Drag the backing region left or right.
Mute / Solo	Use M / S in the track header. If any track is Soloed, only Soloed tracks play.
Rename	Double-click the track name, type a new name, then press

	Enter or click elsewhere. Esc cancels.
Reorder	Drag the track-name area up or down. Backing tracks reorder within the backing group.
Set loop from backing	Double-click a backing region to make that entire region the Loop Range.

4. VOX Tracks and Recording

Item	Description
Track count	Up to 8 VOX tracks. Use Add VOX to add tracks; X removes a VOX track when more than one exists.
R	Record Arm. Selects the vocal track that will receive the recording.
M / S	Mute / Solo.
Volume / Peak	Each track has its own volume bar and peak meter.
Rename	Double-click the track name. Clicking elsewhere also commits the edit.
Reorder	Drag the track-name area up or down. VOX tracks reorder within the VOX group.

Recording workflow

6. Enable R on the target VOX track.
7. Set COUNT-IN 1 BAR, metronome and MONITOR as needed.
8. Press Record. Press Record again to stop.
9. The completed take appears as a VOX region on the timeline.

5. Editing Vocal Regions

Action	Mouse / key
Split (scissors)	Click the upper half of a VOX region at the desired split point.
Move	Drag the lower half of a VOX region.
Trim	Drag the left or right edge of a region.
Set Export Range	Double-click the lower half of a VOX region to set Export RANGE to that region.
Marquee select	Drag on empty timeline space. Hold Shift to force marquee selection even when starting on a region.
Glue / Merge	Select multiple regions on the same VOX track, then use Glue or press G. Gaps are preserved as silence.
Delete	Select a region and press Delete.
Undo / Redo	Ctrl+Z / Ctrl+Y.

EDITING TIP The upper half of a VOX region is the scissors area; the lower half is the move area. Shift temporarily overrides region tools and forces marquee selection.

6. Loop, Playback and Navigation

Function	Control
Play / Stop	Space toggles playback. The Stop icon also stops playback.
Return to 0:00	Home or the Return to Zero icon.
Create Loop Range	Drag horizontally across the ruler.
Show / hide Loop Range	Use the Loop Range icon. Double-click inside the visible loop on the ruler to hide it.
Repeat	Enable Repeat to loop playback inside the Loop Range. Loop Range and Repeat are separate settings.
Horizontal scroll	Shift+mouse wheel or the scrollbar below the timeline.
Horizontal zoom	Ctrl+mouse wheel or the ZOOM bar.
Track height	Alt+mouse wheel or the vertical bar next to ZOOM.

7. BPM, Time Signature and Metronome

- Adjust BPM with the BPM control at the bottom.
- Choose 3/4, 4/4 or 6/8 from the time-signature selector.
- RULER: BARS shows bars/beats; RULER: TIME switches to time-based display.
- Use the metronome icon to enable/disable the click and the adjacent VOL control for click volume.
- COUNT-IN 1 BAR adds one bar of count-in before recording starts.

8. Software Monitoring and Monitor Reverb

- MONITOR routes the microphone input through Nyan Studio to your headphones/output.
- REVERB affects the monitoring path only. The recorded vocal remains dry.
- The REVERB range is intentionally limited for a practical vocal-monitoring amount.
- Use headphones to avoid feedback when software monitoring is enabled.
- If your audio interface also provides Direct Monitoring, using both at once may create a doubled/echoed vocal.

LATENCY If monitoring latency is distracting, choose an ASIO device in AUDIO SETTINGS and adjust the audio-driver buffer size.

9. Mixer and Peak Meters

- Each Backing and VOX track has its own Volume control and Peak Meter.
- MASTER adjusts the final output level.
- The MASTER stereo meter shows left/right output peaks.

- If the output exceeds 0 dBFS, CLIP turns red and stays lit. Click the CLIP area to reset it.

10. Export and Vocal Stem Export

Normal Export

10. Choose WAV / FLAC / AIFF, 44.1 or 48 kHz, and the desired bit depth from the top bar.
 11. Set Export RANGE if needed by double-clicking the lower half of a VOX region.
 12. Click Export and choose a destination file.
- 32-bit float is available for WAV only.
 - Normal Export follows the same Mute/Solo routing as playback and applies MASTER Volume.

Vocal Stem Export

- Choose a folder with the Stem Export icon. Nyan Studio creates one file per eligible VOX track.
- Muted VOX tracks, or tracks with no audio inside Export RANGE, are skipped.
- Each VOX Track Volume is applied. Backing tracks, MASTER Volume, metronome and Monitor Reverb are not included.

11. Session Files

- The current session extension is .nyanstudio. Legacy .nearstudio sessions are also available in the Open dialog.
- Saving creates a matching “SessionName_Audio” folder next to the .nyanstudio file and copies backing/recorded audio into it.
- The session stores BPM, time signature, track names, Mute/Solo, volumes, region positions, loop state, Export Range, zoom and other working settings.
- When Windows file association is installed, .nyanstudio files can use the dedicated Nyan Studio Session icon.

IMPORTANT When moving or backing up a session, keep the .nyanstudio file together with its matching “_Audio” folder.

12. Keyboard and Mouse Shortcuts

Shortcut	Action
Space	Play / Stop
R	Record / Stop Recording
Home	Return to Zero
Delete	Delete selected region
G	Glue / Merge selected regions
Ctrl+Z	Undo
Ctrl+Y	Redo
Ctrl+S	Save Session
Ctrl+O	Open Session

Ctrl+N	New Session
Shift+Wheel	Horizontal scroll
Ctrl+Wheel	Horizontal zoom
Alt+Wheel	Track height

13. Troubleshooting

Problem	Check
No microphone monitor	Check the input device in AUDIO SETTINGS, MONITOR status and headphone/output routing.
Monitoring feels delayed	Try ASIO and a smaller driver buffer. Also check that Direct Monitoring and Software Monitoring are not both active.
Backing is silent	Check M/S states, track volume and MASTER Volume.
Export is unavailable	Confirm a backing is loaded and Export RANGE has a non-zero length. Use WAV for 32-bit float.
CLIP is red	Lower track/master levels, then click the CLIP indicator to clear it.
Session audio is missing	Make sure the .nyanstudio file and its matching “_Audio” folder are together.

Nyan Studio v1.1.0

Simple recording. Direct editing. Comfortable vocal monitoring.
